Recap

In this sprint we implemented queries described in the sql queries model. This covers the competencies:

- Select-From-Where queries
- Aggregation
- Sub queries

Due to time we unfortunately weren't able to demonstrate the competencies in the Advanced SQL model.

For the final sprint, we plan to cover the module competencies that we missed for the scope of Sprint 2. Then we will plan to cover the remaining modules ACID transactions, Basic security, and analyze query algorithms.

ACID transactions:
We will expand our database to ensure customers can take rentals with respect to ACID transactions.

Basic security:
Ensure customers aren't able to view the personal information of other customers when querying.

analyze query algorithms:
Analyze our current query statements with respect to runtime performance and then make improvements to our queries for better performance.
