Sprint 2 - P1 SQL Query Evidence

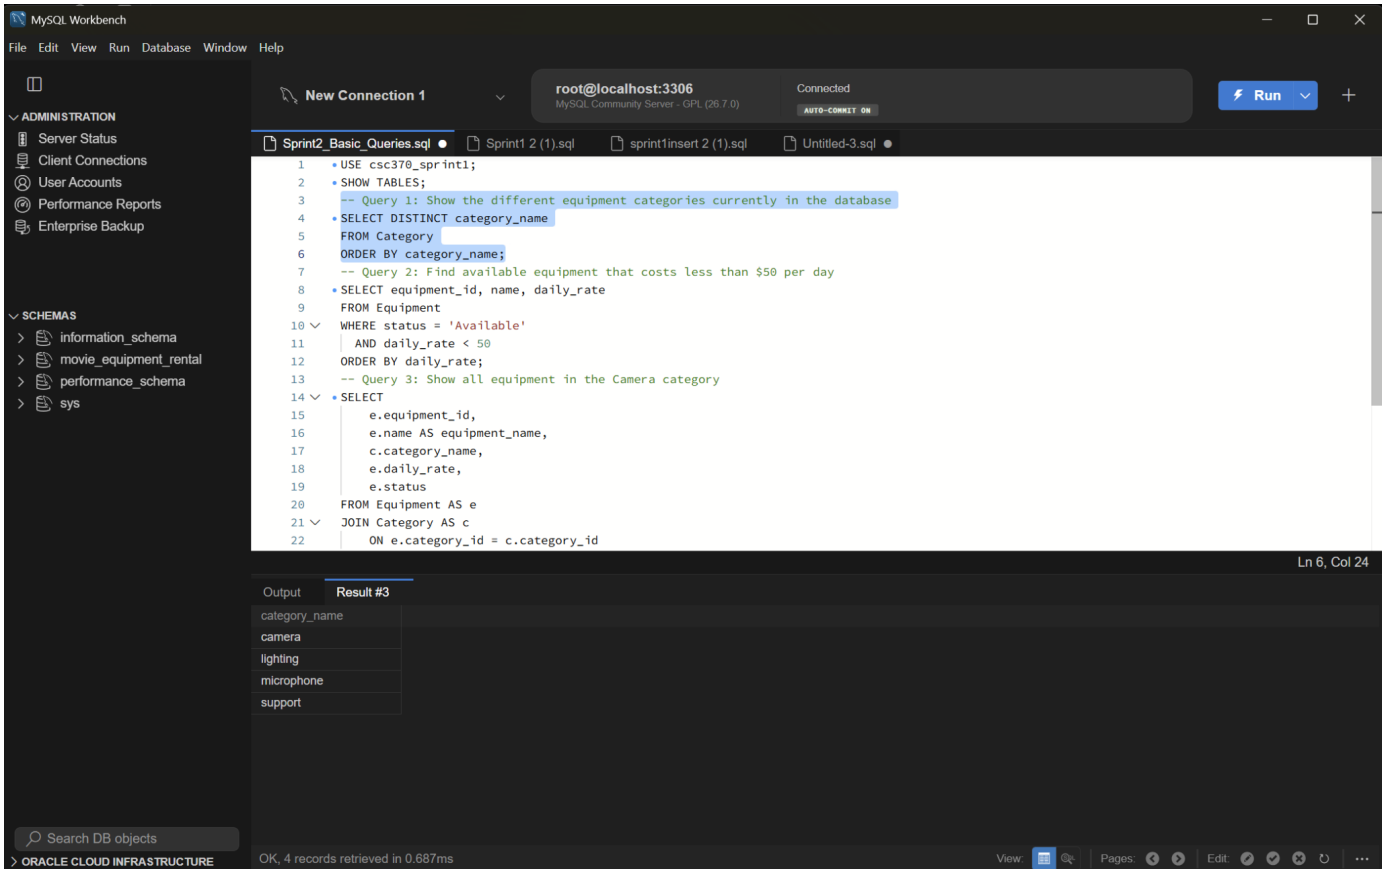

Film Equipment Rental Database

This document contains the four SQL queries completed for Part 1 of Sprint 2, rerun against the same csc370_sprint1 database and sample data submitted for Sprint 1. Each query includes a short explanation and a MySQL Workbench screenshot showing the successful result.

Query 1 - Distinct Equipment Categories

```
SELECT DISTINCT category_name
FROM Category
ORDER BY category_name;
```

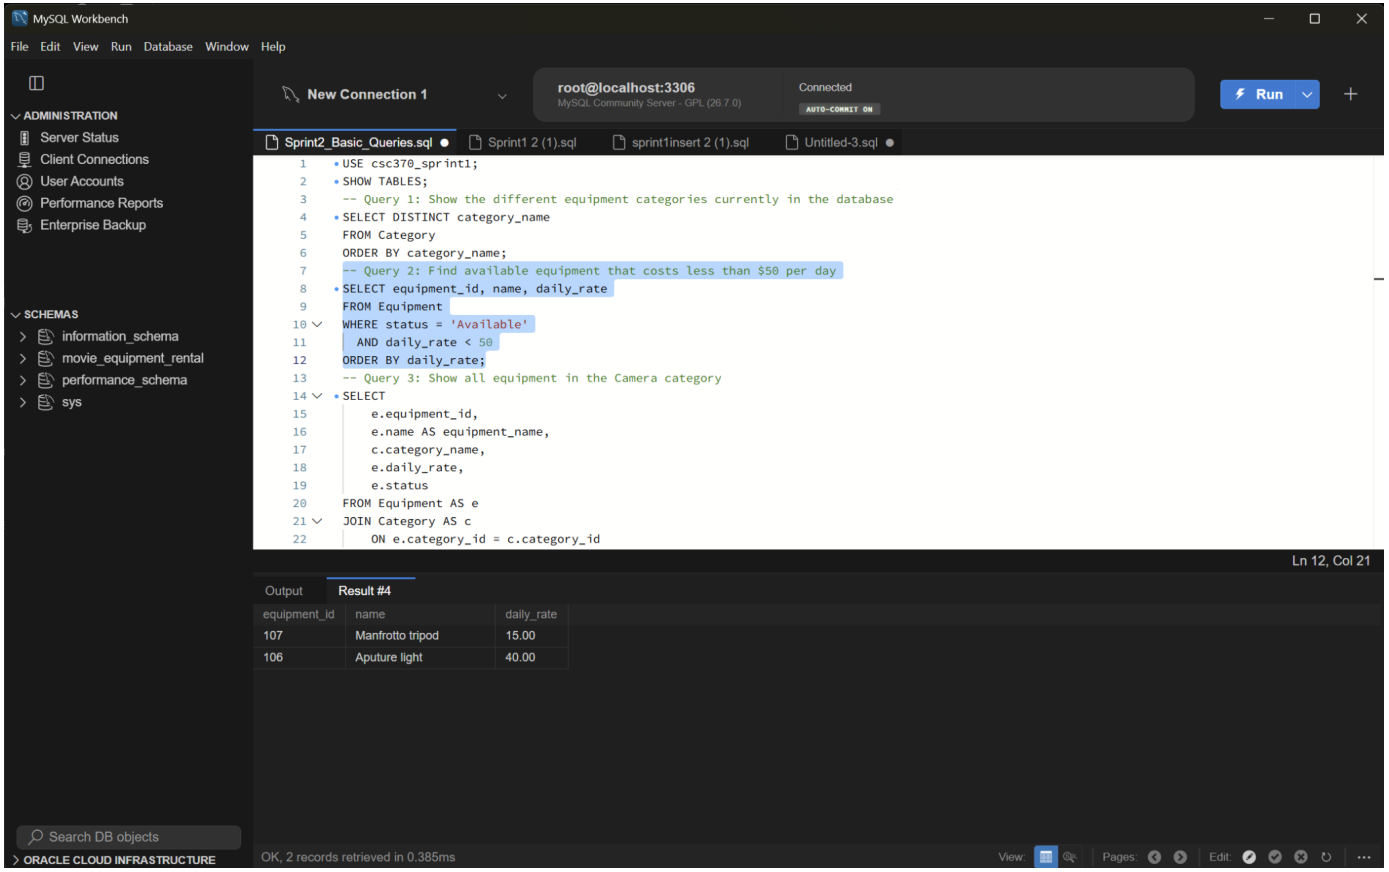

This query uses DISTINCT to list each equipment category once and ORDER BY to sort the results alphabetically. Using the submitted Sprint 1 database, the result contains camera, lighting, microphone, and support.

Query 2 - Available Equipment Under $50

```
SELECT equipment_id, name, daily_rate
FROM Equipment
WHERE status = 'available'
  AND daily_rate < 50
ORDER BY daily_rate;
```

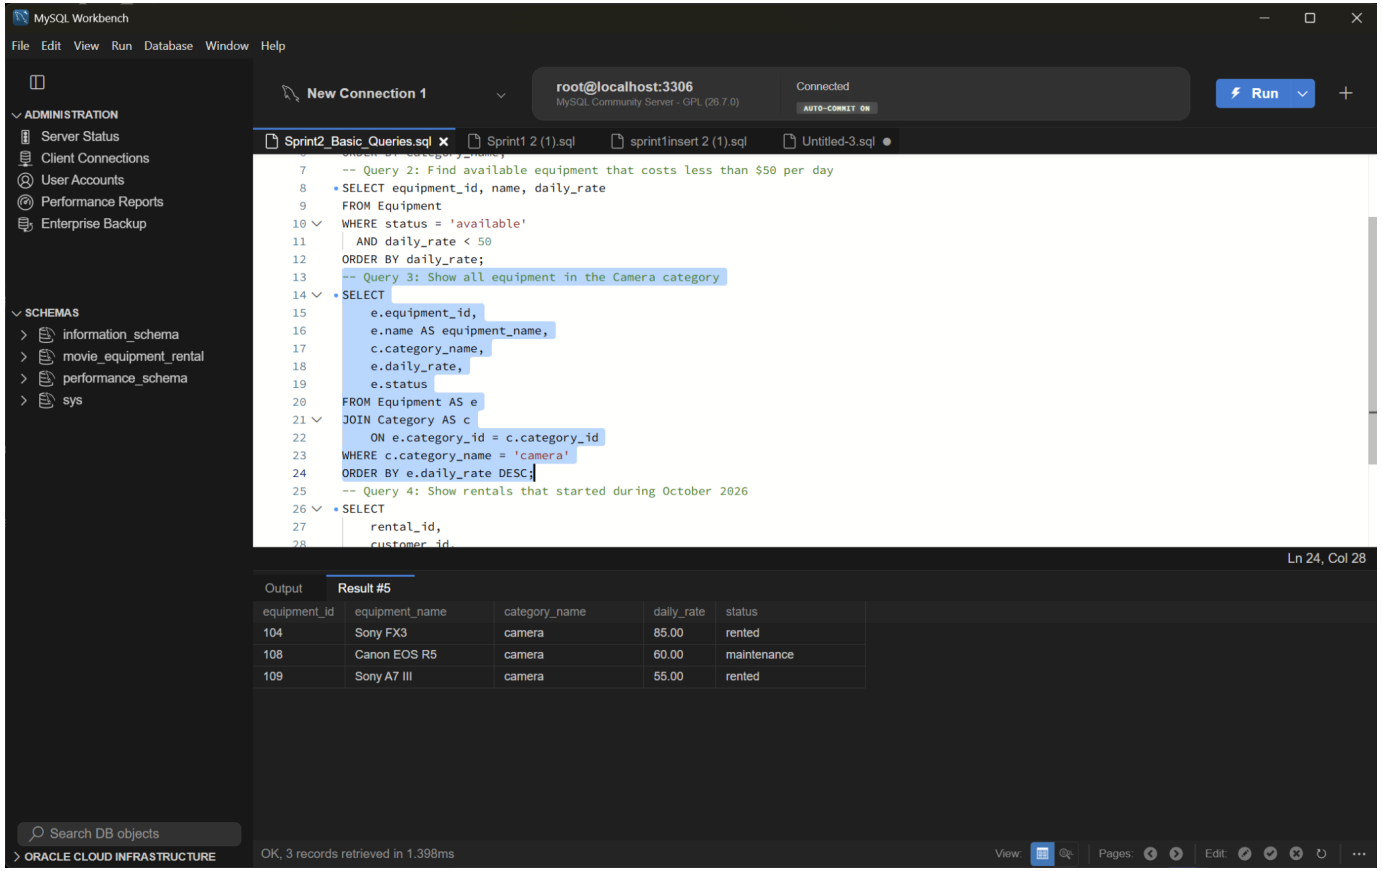

This query filters the Equipment table to items that are available and cost less than $50 per day. The result returns the Manfrotto tripod at $15.00 per day and the Aputure light at $40.00 per day.

Query 3 - Equipment in the Camera Category

```
SELECT
    e.equipment_id,
    e.name AS equipment_name,
    c.category_name,
    e.daily_rate,
    e.status
FROM Equipment AS e
JOIN Category AS c
    ON e.category_id = c.category_id
WHERE c.category_name = 'camera'
ORDER BY e.daily_rate DESC;
```

This query joins Equipment and Category using category_id, then filters the joined result to the camera category. The result returns the Sony FX3, Canon EOS R5, and Sony A7 III, along with their daily rates and current statuses.

Query 4 - Rentals Starting in October 2026

```
SELECT
    rental_id,
    customer_id,
    CAST(rental_date AS CHAR) AS rental_date,
    CAST(expected_return_date AS CHAR) AS expected_return_date,
    CAST(actual_return_date AS CHAR) AS actual_return_date
FROM Rental
WHERE rental_date >= '2026-10-01'
  AND rental_date < '2026-11-01'
ORDER BY rental_date;
```

This query filters Rental records to those that started during October 2026. CAST is used only for display so MySQL Workbench shows the stored DATE values correctly. The result returns rentals 22, 20, and 23.
